So I'm honored and thrilled to be able to put out a product I feel is going to make a difference. Diabetic nephropathy and the nephrotic syndrome. Approximately one-third of people with diabetes have nephropathy, the clinical manifestations of which range from asymptomatic microalbuminuria to renal failure. In most cases, it is essential that the renal status is assessed promptly because progression of diabetic nephropathy may be halted by improved glycaemic control or treatment of hypertension. Even at the stage of microalbuminuria, the renal glomerular filtration rate and renal blood flow are reduced, and proteinuria is present. In people with diabetic nephropathy and the nephrotic syndrome (edema, hypoalbuminaemia and hyperlipidaemia), the glomerular filtration rate is reduced to near normal levels, and there is a reduction in serum albumin levels. Apart from renal and cardiovascular disease, which are the most common causes of death in patients with diabetes, nephropathy also increases the risk of foot ulcers and deep vein thrombosis. In addition, it is important to treat patients with diabetic nephropathy and the nephrotic syndrome effectively, because these conditions are associated with a higher incidence of fractures and of new and recurrent infections. Treatment of nephropathy involves control of blood pressure, maintenance of glycaemic control and avoidance of nephrotoxic drugs. Avoidance of angiotensin-converting enzyme inhibitors in patients with diabetic nephropathy and the nephrotic syndrome may be prudent to avoid additional risk of hyperkalaemia. The British Diabetic Association has developed guidelines for the treatment of diabetic nephropathy and the neph 82157476af
