Conker: Bad Fur Day Twelve Tales: Conker 64 First Click on "Download Game" button above. Q: Simple way to find the implicit maximum of an implicit function I am working on a project in which I need to find the solution to an implicit equation, and it has the shape (f(t)+g(t))/(1+h(t))=x For example, x=7, f=2, g=-5, h=-1. I could just try out some values in t manually, but I am looking for a way to do it without. Is there any way to solve this for t (or x), without having to do anything complicated like Newton-Raphson? A: If you can afford to lose memory, you could try Brent algorithm, and here is a simple implementation. function [tret,tempr]=brentt(L,f,g,h,x) fh = 1/h; gf = 1/f; Gt = 1/g; f = x - f*f; ftmp = 1 - f f678ea9f9e
